Solution Datasheet

Sharelock
for ONE IDENTITY™

"Oh, if only we had noticed that strange change of employee activity behaviour three months ago. This was one early signal of the attack, but nobody noticed it."

Get a little help from your Identity friends !

Infuse Sharelock Behavioral Risk Insights into One Identity Manager, and enable Line of Business managers to be part of your extended security team, evaluating selected anomalous behaviors early on rather than late on. Inside the One Identity Manager UI they use every day.

The Challenge

How often do you hear such a *'too late'* comment after a data breach, fraud or ransomware attack?
And you'll keep hearing it unless your start involving business people and asking them to evaluate those very anomalous behaviours performed by their employees/contractors are either a business-justifiable exception or the early signal of a downstream security situation.

The solution at a glance

Sharelock detects anomalous user behaviors against the individual behavioral baselines, correlate such set of anomalies against its insider threat models, and then signals to One Identity Manager Security situations (e.g. suspected account compromise, suspected data sabotage) and Recommendations for suggesting *«keep/review/revoke»* actions on specific applications.

All these risk insights are then made available inside One Identity Manager with pre-configured rules and workflows, enabling Line Managers to act within the One Identity UI and provide their valuable business contributions on such 'application related' security situations.

Capability overview

Sharelock delivers two types of 'signals' to One Identity Manager:

- **(Potential) Threats/Security alerts:** According to the Sharelock correlation engine, the given user has 'many' behavioral anonomalies triggering a specific threat (e.g. data exfiltration attempt).

- **(Access) recommendations:** Sharelock suggests recommendations to close the gap between 'should be' vs 'as is'. Recommendations are either 'remove', 'consider revocation' or keep.

Sharelock for **ONE IDENTITY™**

Security Alerts

Sharelock detects anomalous behaviors against the predefined IoBs (Indicators of Behavior) and then correlates multiple anomalous behaviors for preventing threats such as compromised accounts, data exfiltration activities or other risky situations resulting from several anomalies.

Such security alerts are sent to One Identity Manager so that the Line Manager can review them and investigate accordingly in the One Identity Manager UI.

Sharelock
for ONE IDENTITY™

(Access) Recommendations

Sharelock features a powerful peer-grouping analytics capability and leverages it to provide recommendations ('keep', 'remove', etc.) in the One Identity Manager UI. Such recommendations aim to close the gap between the '*should be*' state - described in One Identity Manager - and the '*as is*' state derived from actual behaviors.

Benefits

Zero trust risk management posture

- Achieve an 'early on' rather than 'oh too late' Zero trust security posture

- Infuse behavioral insights into One Identity Manager with the out-of-the-box integration with Sharelock.

- Enable Business users to easily provide their contributions on risky situations and recommendations

Protection of the investment

- Protect and enrich your investment with One Identity Manager.

- No change management impact, Line Managers use their everyday One Identity Manager UI and processes.

- No additional skills: the Sharelock integration package with One Identity Manager is built using standard One Identity configuration features (UI, workflows and data model extensions).

Sharelock

About us

Sharelock.ai is a leading provider of AI-powered Identity Behavioral Insights for the Zero Trust Identity architecture.

Founded by CrossIdeas Identity veterans, Sharelock bridges the gap between Identity Management and Security Intelligence, enabling business users to prevent security risks connected to anomalous user behaviors, early on rather than 'oh, too late.'
