PeerStory: One Identity Active Roles

This PeerStory is a collection of quotes from a real user sharing their experience using One Identity Active Roles on PeerSpot.

Bhupesh M.
Technical Specialist at LSEG

★★★★☆

Use Case

I use One Identity Active Roles primarily for identity management. We use it for managing multiple domains from a single interface, and the domains do not have trust between them. It has been used by multiple support teams, such as the service desk or the identity access management team for account creation, modification, and management of accounts. It is mostly focused on account creation, modification, deletion, and AD objects.

Valuable Features

The best features of One Identity Active Roles include **managing multiple domains from a single interface**. I don't need to log into jump servers, making it very easy to log in from the web and manage it. Dynamic groups are also one of the best features, eliminating the need to add or manage members manually.

> **"The granular control is exceptional; we can give the least control required by the team. For modifying any group, we don't have to give create and delete roles; we can just give them the move role."**

> **"I would recommend One Identity Active Roles based on its ability to manage domains from a single interface and provide minimal-required access based on work requirements. The web interface login and MMC console are very user-friendly."**

The management unit is another excellent feature, which we can use as a virtual OU to identify missing elements.

Results

One Identity Active Roles has **helped my organization reduce the number of incorrect privileged accounts** through the management unit feature. It helps us identify accounts that are not in use, and while creating admin accounts, we use it to set policies regarding which required fields must be filled during account creation. This helps us keep the process clean and ensures all required attributes are filled before account creation. We have scheduled scripts on One Identity Active Roles that check if activity meets criteria. If it doesn't, it will move the account to a specified OU, disable it, or delete it, as per the defined process.
