PeerStory: One Identity Safeguard

This PeerStory is a collection of quotes from a real user sharing their experience using One Identity Safeguard on PeerSpot.

Dishant S.
CTO at DishIs Technologies

★★★★⯨

Use Case

Our main use case for One Identity Safeguard is access management and session management for our privileged users.

Valuable Features

We mostly rely on the session management and vault system features of One Identity Safeguard. In my experience, the best features One Identity Safeguard offers are mostly related to session management, which are highly automated and make a lot of sense.

Results

The automation of session management with One Identity Safeguard helps us significantly, as it **saves us a lot of time and reduces errors**.

> "The affordability of One Identity Safeguard has allowed us to allocate budget elsewhere, particularly towards integrating it with OneLogin, which helps us manage our increasing user base's needs and costs."

> "We use One Identity Safeguard for password vault safety, ensuring that most of our privileged users receive a different password each time they log in so that the admin doesn't know the password, thereby protecting the entire system."

Since many of our developers and privileged users are still learning, they tend to make mistakes, and One Identity Safeguard points those out, helping us avoid major issues.

ROI

We have seen a 12% return on investment with One Identity Safeguard, and we have **saved a significant amount of money**. When we were using CyberArk, it was very costly, and One Identity Safeguard is much cheaper in the long run.
